Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-399) of 294-311), located in the third intracellular loop of the receptor mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-AR norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the antihypertensive effect of compounds. The present sequence is alpha-2B-adrenoceptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by determining the pattern of alleles encoding

                                                                                                                                                                                                                                                                                                                                                         The present invention describes antigenic peptides (I) comprising:
CC (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino
CC acids. Also described: (1) an assay for the detection of a particular
CC and (2) an isolated antibody having high specificity and high affinity
CC and (2) an isolated antibody having high specificity and high affinity
CC antibody against a particular GPCR. (I) can be used as GPCR modulators and
CC an antibody against a particular GPCR, and in the production of specific
CC presence or absence of corresponding GPCRs. The antigenic peptides for
CC presence or absence of corresponding GPCRs. The antigenic peptides for
CC creating immune-related diseases, growth-related diseases, cell
CC diseases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease,
CC diseases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease,
CC atheroscierosis, bacterial, fungal, protozoan or viral infections,
CC diseases, Parkinson's disease, and tiple sclerosis, pain, psoriasis,
CC disease, Parkinson's disease, diabetes, graft versus host
CC disease, Parkinson's disease, diabetes, graft versus host
CC disease, Parkinson's disease, diabetes, pain, psoriasis,
CC anxiety, depression, schizophrenia, dementia, mental retardation, memory
CC any other disorder in which GPCRs are involved. The antibodies may be
CC GPCR proteins given in ABB81675 to ABB82018, which are used in the
CC exemplification of the present invention.
                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                       Query Match
